## ABOUT THE MANUFACTURER

IKO Insulations is part of the international IKO Group. The IKO group is a leading manufacturer of asphalt shingles, roofing membranes, PIR insulation and liquid waterproofing in both North America and Europe. More information on [www.iko.com](http://www.iko.com). Within the IKO Group, IKO Insulations develops, produces and distributes innovative PIR (Polyisocyanurate) based insulation products under the IKO enertherm brand. Manufacturing In Europe is centred in three state-of-the-art factories.

## PRODUCT DESCRIPTION

IKO enertherm ALU FB is a thermal insulation board with a core of rigid polyurethane foam coated both sides with a multilayer gas-tight aluminium complex. The EPD is calculated for 1 m<sup>2</sup> of insulation board with a thickness of 160 mm an Rd value of 7,25 m<sup>2</sup>.K/W. The product can be used as thermal insulation in floor, wall and roof applications.

## MANUFACTURING AND PACKAGING (A1-A3)

The environmental impacts considered for the product stage cover the manufacturing of raw materials used in the production as well as packaging materials and other ancillary materials. Also, fuels used by machines, and handling of waste formed in the production processes at the manufacturing facilities are included in this stage. The study also considers the material losses occurring during the manufacturing processes as well as losses during electricity transmission.

The insulation boards are produced on a continuous double-belt laminator by mixing and pouring the raw materials on a conveyor. The insulation board is top and bottom covered with a facer. Boards are side trimmed and cut the required length. The finished insulation boards are stacked on EPS blocks and wrapped in PE foil and moved to storage. Off-cuts are compressed as briquettes and transported to landfill.

## TRANSPORT AND INSTALLATION (A4-A5)

Transportation impacts occurred from final products delivery to construction site (A4) cover fuel direct exhaust emissions, environmental impacts of fuel production, as well as related infrastructure emissions.

Transportation impacts occurred from final products delivery to construction site (A4) cover fuel direct exhaust emissions, environmental impacts of fuel production, as well as related infrastructure emissions. The average transportation distance of 800 km from factory to construction sites in Italy. A weight loss from cutting process during installation of 3.5% is considered (A5) and transported to landfill. 50% of the packaging waste (PE film) is considered to be recycled and 50% to be landfilled. 50% of the EPS legs packaging is assumed to be recycled and 50% landfilled. Transportation distance to the closest disposal area is estimated as 50 km and the transportation method is assumed as lorry which is the most common.

## PRODUCT USE AND MAINTENANCE (B1-B7)

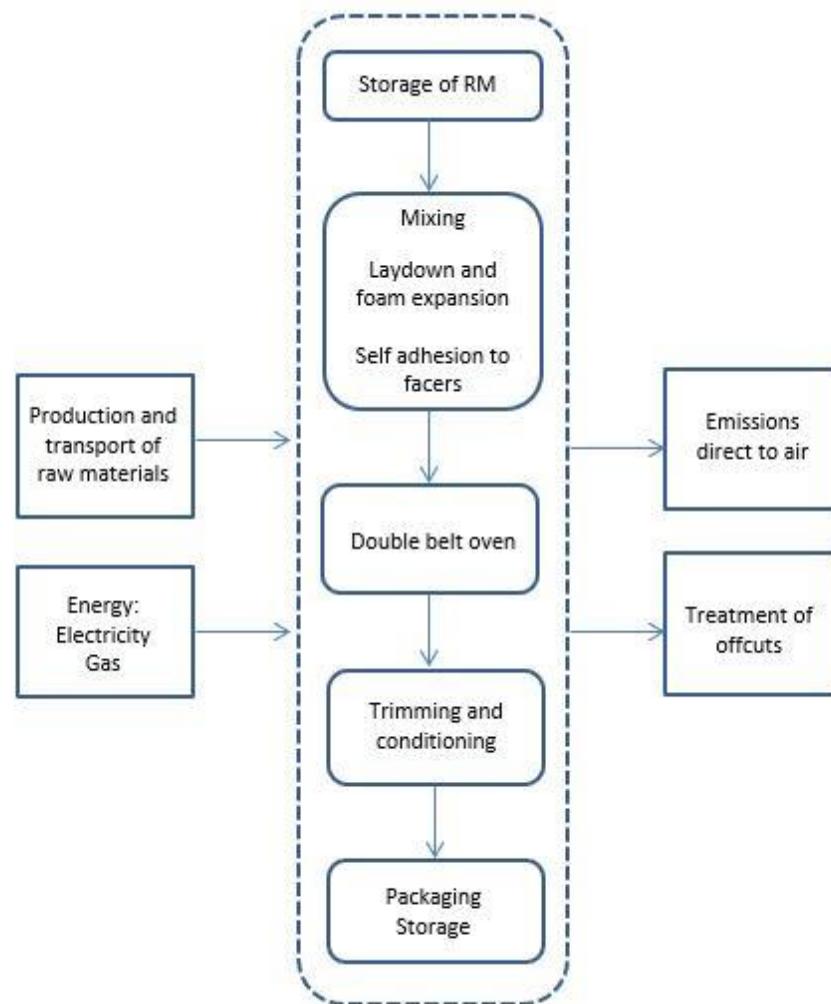

No maintenance is required during the lifetime of the product. Air, soil, and water impacts during the use phase have not been studied.

Air, soil, and water impacts during the use phase have not been studied.

## PRODUCT END OF LIFE (C1-C4, D)

Consumption of energy and natural resources in demolition process is assumed to be negligible. (C1) The distance for transportation to disposal is assumed as 50 km and the transportation method is assumed to be lorry. (C2) 100 % of end-of-life foam is assumed to be landfilled. (C3, C4) Converted energy due to the incineration of packaging materials are considered as benefits. (D)

## MANUFACTURING PROCESS

# LIFE-CYCLE ASSESSMENT

## CUT-OFF CRITERIA

The study does not exclude any modules or processes which are stated mandatory in the reference standard and the applied PCR. The study does not exclude any hazardous materials or substances. The study includes all major raw material and energy consumption. All inputs and outputs of the unit processes, for which data is available for, are included in the calculation. There is no neglected unit process more than 1% of total mass or energy flows. The module specific total neglected input and output flows also do not exceed 5% of energy usage or mass.

## ALLOCATION, ESTIMATES AND ASSUMPTIONS

Allocation is required if some material, energy, and waste data cannot be measured separately for the product under investigation. All allocations are done as per the reference standards and the applied PCR. In this study, allocation has been done in the following ways:

Data type	Allocation
Raw materials	No allocation
Packaging materials	No allocation
Ancillary materials	No allocation
Manufacturing energy and waste	Allocated by mass or volume

## AVERAGES AND VARIABILITY

9) This indicator includes all greenhouse gases excluding biogenic carbon dioxide uptake and emissions and biogenic carbon stored in the product as defined by IPCC AR 5 (IPCC 2013). In addition, the characterisation factors for the flows - CH<sub>4</sub> fossil, CH<sub>4</sub> biogenic and Dinitrogen monoxide - were updated in line with the guidance of IES PCR 1.2.5 Annex 1. This indicator is identical to the GWP-total of EN 15804:2012+A2:2019 except that the characterization factor for biogenic CO<sub>2</sub> is set to zero.
